Linguistic knowledge-based systems • Linguistic knowledge-based systems include knowledge of both the source and the target languages. • We will book at direct transfer systems and then the more specific instance of interlinguas. • Direct transfer systems • Interlinguas	Language and Companies Tage 2 May 2	Direct transfer systems A direct transfer systems consists of: • A source language grammar • A target language grammar • Rules relating source language underlying representation to target language underlying representation	Language and Computers Tage & Management Tage &	Direct transfer systems (cont.) A direct transfer system has a transfer component which relates a source language representation with a target language representation. This can also be called a comparative grammar. We'll walk through the following French to English example: (7) Londres plait à Sam. London is pleasing to Sam Sam like London:	Language and Company and Topic Students Tipic Students St
Steps in a transfer system 1. source language grammar analyzes the input and puts it into an underlying representation (UR). Londres plat à Sam – Londres plaire Sam (source UR) 2. The transfer component relates this source language UR (French UR) to a target language UR (English UR). French UR English UR X plaire Y += English translation of X) (where EnglX) means the English translation of X) Londres plaire Sam (source UR) -> Sam like London (arget UR) 3. target language grammar translates the target language UR into an actual target language sentence. Sam like London -> Sam likes London.	Linguage and Computers Tage 2 No. 10	Things to note about transfer systems The transfer mechanism is essentially reversible; e.g., the plaire rule works in both directions (at least in theory) Because we have a separate target language grammar, we are able to ensure that the rules of English apply: 180 — 180s. Word order is handled differently than with transformers: the URs are essentially considered. The underlying representation can be of various levels or representations, etc.; we will talk about this with the translation triangle.	Language and Computers 1 Tage 6 Months 1 Tage	Caveat about reversibility It seems like reversible rules are highly desirable—and in general they are—but we may not always want reversible rules. e.g., Duch aniwangers should be translated into English as Degin, but English begin should be translated into Dutch as beginner. Levels of abstraction - There are differing levels of abstraction at which transfer can take place. So far we have looked at URs that represent only word information. - We can do a full syntactic analysis, which helps us to know how the words in a sentence relate. - Or we can do only a partial syntactic analysis, such as representing the dependencies between words.
