Error analysis So, we have a lot of different technology we can use. For many of the exercises we will want to use, the user types in something, and, using more technology, we want to find the error(s) in it. Two main issues: Firor recognition: What is the error? Feedback: What do you do about the error? (What do you led the learner?)	Language and Company and Topic GNLL Language service Topic GNLL Language service flow of the service service flow of the service service flow of the service flow of t	Types of systems for error recognition (and feedback) Helit (Intelligent Language Tutoring Systems for Grammar Practice) - systems which present only the correct answer — no attempt to find an error - systems which pinpoint the error by a letter-by-letter comparison between student's answer and correct answer (fine ar systems) - systems which are systems) - systems which are systems and provide linguistic analysis of sentence	Language and Company and Topic Co. Language and Language department of the service of the servic	Error recognition issues How do we adapt our technologies to find errors? Do we tailor the system to a particular kind of learner? Do we tailor the system for an individual learner? What is the secart error? How many errors are there?	Language and Companies Topics & Chill. Language lasting for the part of the pa
How do we adapt our technologies to find errors? Our parsers, morphological analyzers, and so on, are made to handle well-formed input. Use so-clided mal-rutes - rutes which are added to your grammer that handle error cases. • e.g., * Ingular noun and a plant web are allowed to combine, but it is marked error cases. • Modily your benchnology: a parser can be reworked to the standard of the properties	Language and Company and Compa	Do we tailor the system to a particular kind of learner? • Some systems write mak-rules specifically designed to handle a particular type of learner, e.g. Korean learners of English. • Can look at corpora and find the most common errors → can create an error typology = a classification of errors into different groups. • Main problem is a lack of generality.	Language and Company Trape & CALL Language paramite Language paramite from representation from representat	Do we tailor the system for an individual learner? i.e. Do we keep track of a student model = what level each student is at, for a given task? Allows us to say which grammatical points need more work for a given individual. Allows us to give individual. Allows us to give different feedback based on the learner's abilities. Make sure the learner knows the terminology presented in the feedback. e. g., John are big. Beginner "John is a singular subject and are is a plural vertio." hiermendate: "There is a subject-werb agreement error." Advanced: "There is an error."	Language and Company Topic & Child. Language landing in the Child of t
What is the error? Take this hypothetical example of someone learning Englist: Swimmer liked to awim. Did the learner mean: Swimmer liked to awim (problem with plurals) determinens) Finding an error is one thing. Figuring out what the learner meant is another (similar to spell checking).	Language and Computers Tagle & CALL Language Lan	Number of errors Heilt 2001 reports that 40% of sentences for German learners contained more than one error. Don't want to overwhelm students with too much feedback. Can present one error at a time. Instructors can divide the errors into primary errors and secondary errors – or rank them somehow.	Language learning Topic C-ALL Language learning	An example system Example system from Heift and Nicholson (2001), which is general (any native language) and which is able to capture different kinds of errors because the exercises are very constituented (as well see leafly). Student Input - String match: If the input matches a pre-defined correct answer, we know it's good. Prevents time-consuming analysis for perfect answers. Punctuation check	Language learning Topic of Chil. Language learning Topic of Chil. Language learning learnin
