Data : CREG

<u>C</u>orpus of <u>R</u>eading <u>E</u>xercises in <u>G</u>erman [Meurers et al., 2010]

- longitudinal learner corpus collected at 2 German programs in USA (OSU, KU)
- structure:
 - texts
 - questions
 - target answers (TA)
 - student answers (SA)
 - meta data
 - ▶ links between elements (SA → TA, SA → Diagnosis,...)
- significant variation / deviation of form and meaning in SAs
- binary (and detailed) gold diagnosis of *semantic* correctness of SAs

Hybrid Weighting Approach

- tf.idf lemma-based weighting, adapted from Manning and Schütze [1999]
- generally applicable measure, but task-specific training
- document collection: all reading texts in CREG-5K
- for each aligned token, get *tf.idf* weight in reading text to which the SA refers

$$ol_{tf.idf}(A_h) = \sum_{w_j \in W_{A_h}} weight_{tf.idf}(w_j, d_i)$$

$$weight_{tf.idf}(w_j, d_i) = \begin{cases} 0 & , \text{ if } (w_j \text{ NOT new}) \text{ OR} \\ & (w_j \text{ NOT aligned}) \text{ OR} \\ & (w_j \notin d_i) \\ (1 + \log(tf_{j,i})) \times \log \frac{N}{df_j} & , \text{ otherwise} \end{cases}$$

Task-Specific Weighting Hybrid Approach

Experimental Testing

Discussion

Conclusion

Appendix

Experimental Testing: Main results

- many more tables with accuracies and test statistics ...
- pos features alone result in highest accuracy on one data set (90%)
- tf.idf always yields improvement
- question-types alone not as effective
- best overall result for combination of all 3 weightings
- linguistically interpretable question-type specific pos alignment patterns (Appendix 1)
- question-type specific macro-averages show improvement from Meurers et al. [2011] (Appendix 2)
